Moving from Pythia 5 to Pythia 6

Pythia 6 is the latest stable release of Pythia

Better interoperability with other MC

(eg: HERWIG)

Constants are based on more recent results

(eg: latest LEP results)

Nicolas@post.kek.jp

JSF Framework

- Pythia is used as an hadronizer after generating the events with another generator.

- The JSF Framework provide standard classes for MC generators (JSFGenerator) .

- A standard hadronizer class (JSFHadronizer) is also available.

- The hadronizer gets the data from the generator through Fortran Commons: HEPRUP/HEPEUP
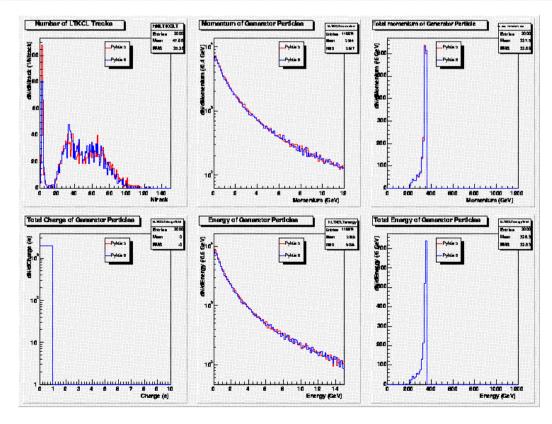

Nicolas@post.kek.jp

HEPRUP & HEPEUP

- To facilitate interoperability between Hadronizers and generator a standard data format has been proposed.

- This standard defines 2 fortran common blocks: HEPRUP for Run User Process information *and* HEPEUP for Events information.

- HEPRUP: beam particles ID, beam energy, Events weighting scheme, subprocesses

- HEPEUP: process ID, Event weight, energy scale, particles history (ID, status, mother, colour flow, momentum, position, spin,...)

Nicolas@post.kek.jp

Interfacing Pythia 6 with Spring

- A class converting the Spring Output to HEPRUP/HEPEUP has been written

- Events have been produced with the new scheme and the previous scheme (based on Pythia 5)

Good agreement between pythia 5 and 6

Nicolas@post.kek.jp

Colour Flow

The colour flow of the particles is determined by the following rules (gluons are not handled):

- Bosons & leptons (ID between 10 and 50) are colourless

- Coloured daughters of a coloured particle carry the same (or opposite) colour

- Daughters of the same particle carry the same (or opposite) colour

- Colour of coloured daughter of colourless particle are assigned with different values

This algorithm will be tested soon on top events

Nicolas@post.kek.jp

Prospects

- Spring/Pyhtia 6 interface is completed

- Colour flow algorithm will be checked soon

- Next step: Implement TAUOLA in the JSF Framework for events with TAU

- Later: new MC Generator for the exotics group
