

# Simulation Study

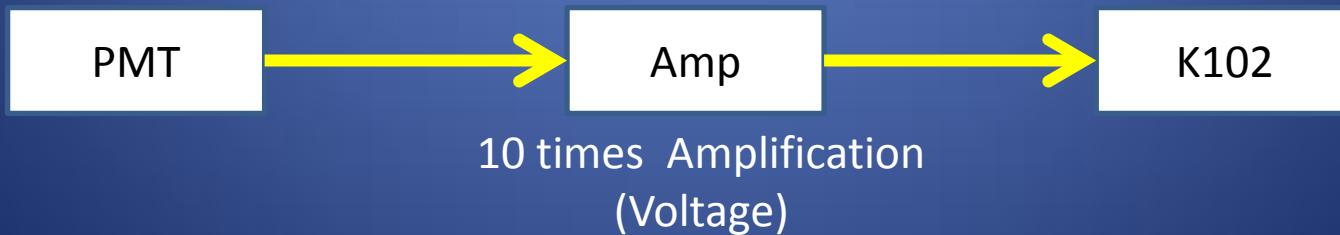

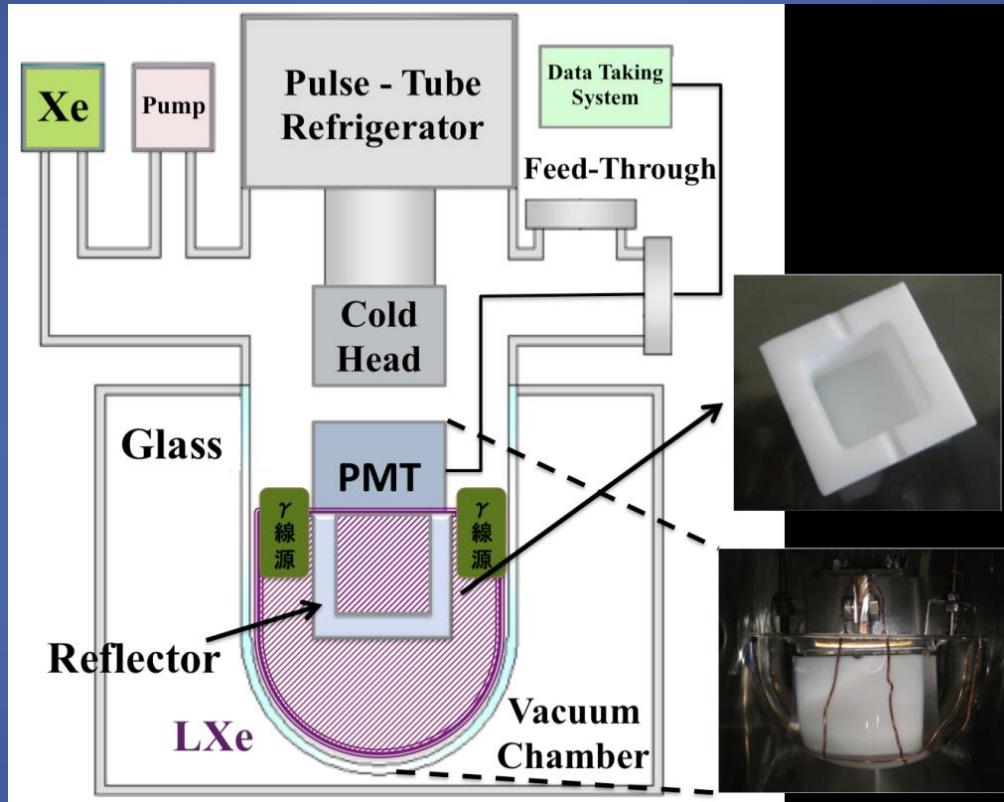

31 Jul. 2013

Hamanishi Ryo

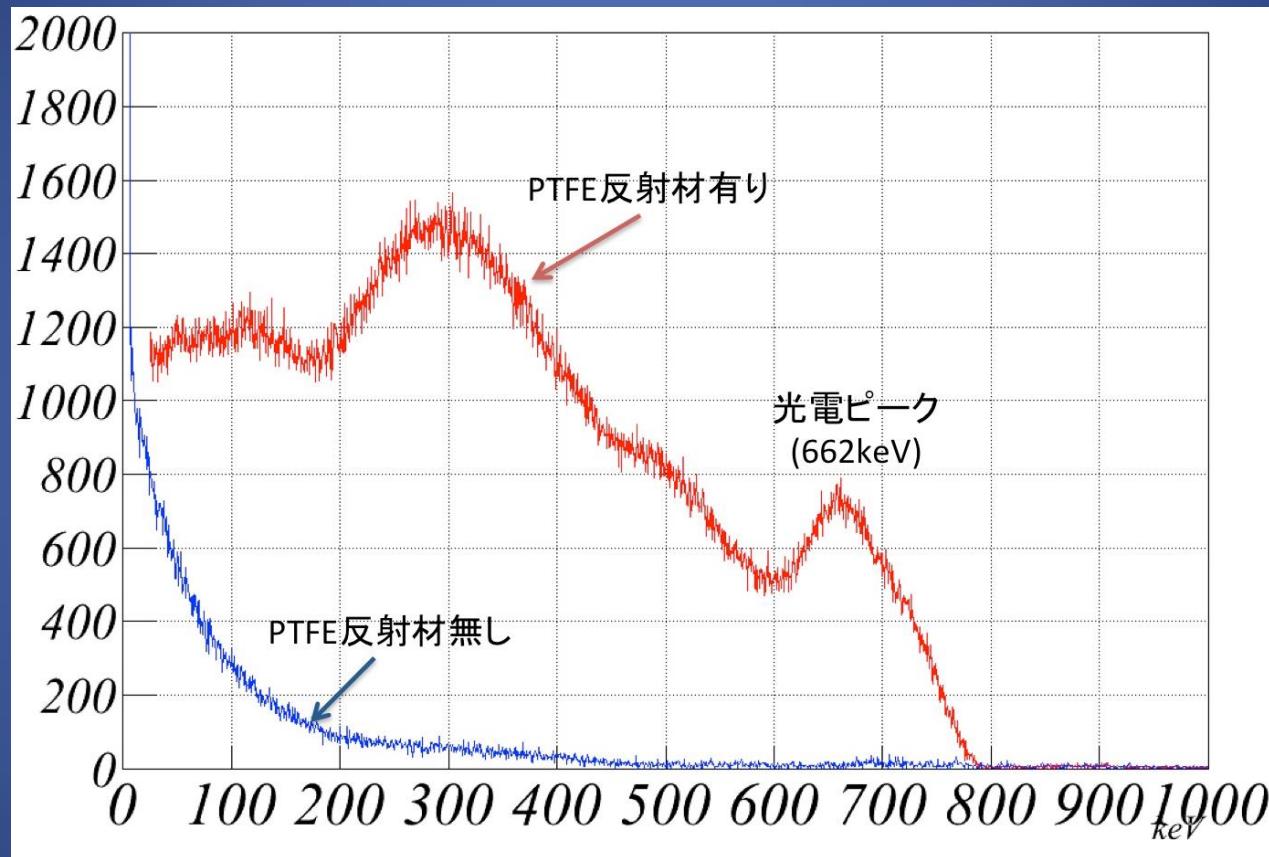

# Geant4 (Geometry and Tracking 4)

- Simulating reaction and behavior of proton, electron, and gamma-ray, etc.
- Decide probability of interaction by random numbers
- Define what physical phenomenon is induced when particles(gamma) interact with Lxe
- If particles disappear or go out space defined by user, simulation is stopped

# Setting of Experiment

# Results of Experiment

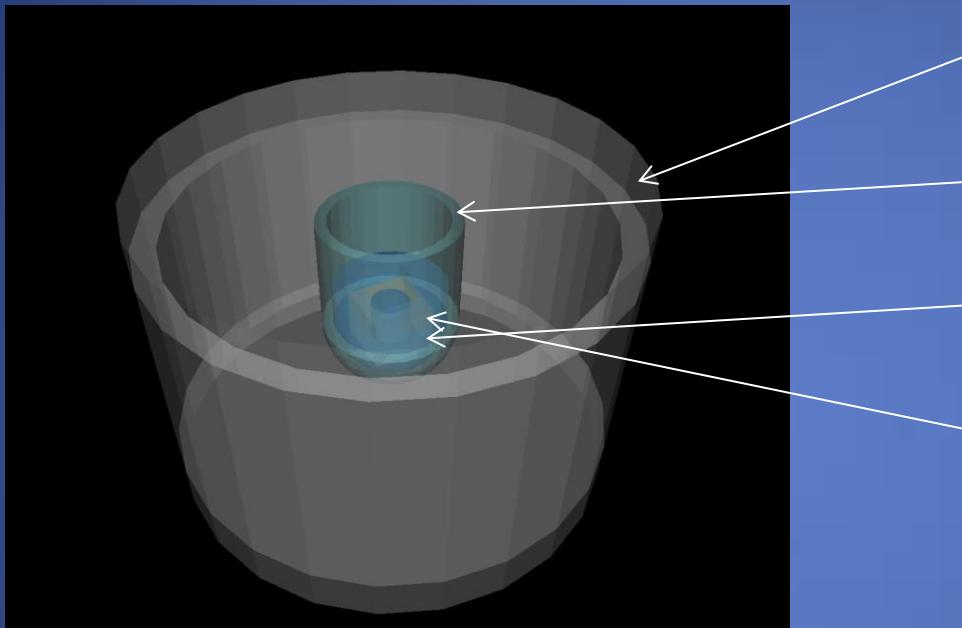

We can not measure gamma-ray spectrum without PTFE reflector.

# Define of System in Geant4

- DetectorConstruction
  - position and size of experimental tools
- PrimaryGeneratorAction
  - first physical information of experiment
- PhysicsList
  - physical process of each particle
- SensitiveDetector
  - responses of detector (ex. Lxe, PMT)
  - get information of interaction in Hit class

# Simulation

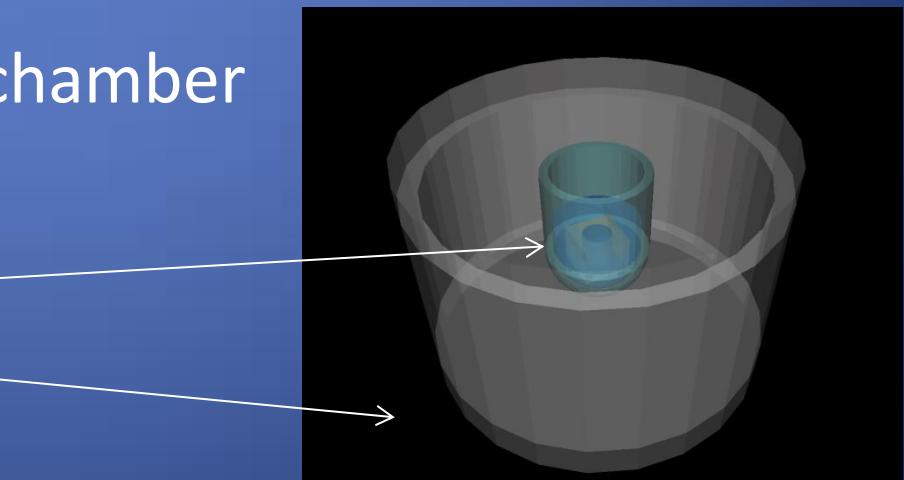

Chamber  
Glass Viewer  
LXe  
Reflectance

- Measure about energy spectrum of  $^{137}\text{Cs}$ ,  $^{22}\text{Na}$  and  $^{60}\text{Co}$
- Change position of gamma source and parameter of reflectance of PTFE reflector
- Count optical photon being incident on detector

# Energy Deposit

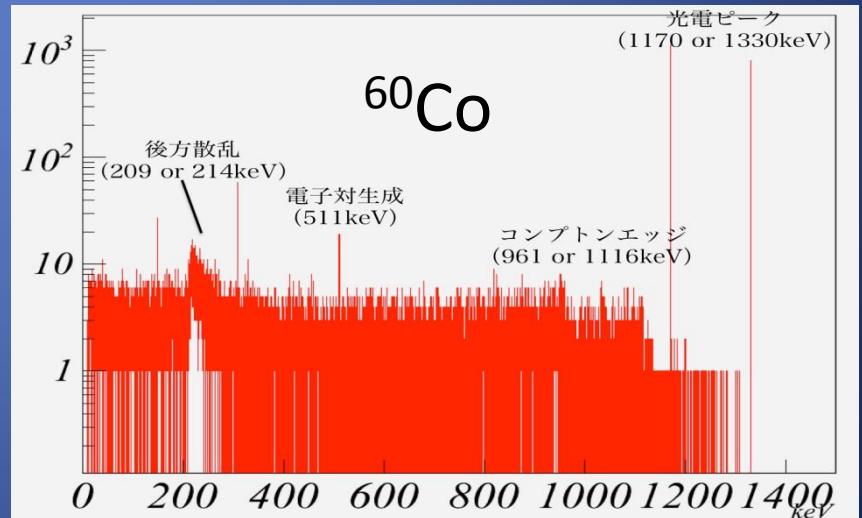

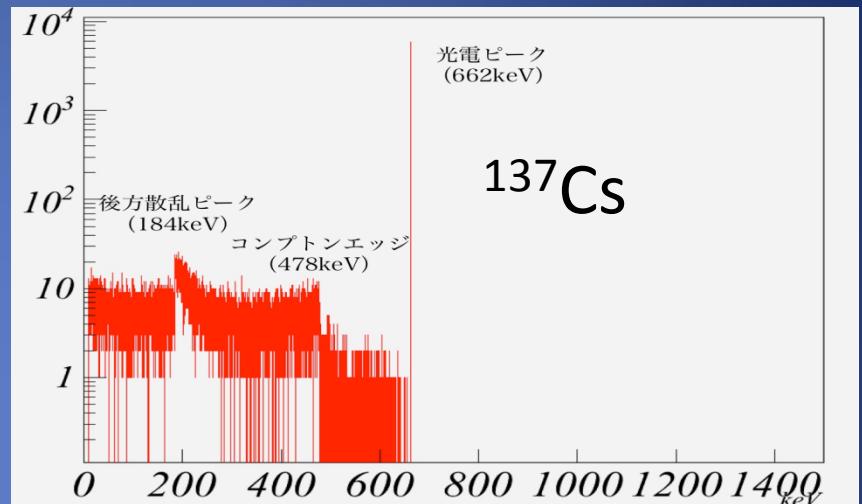

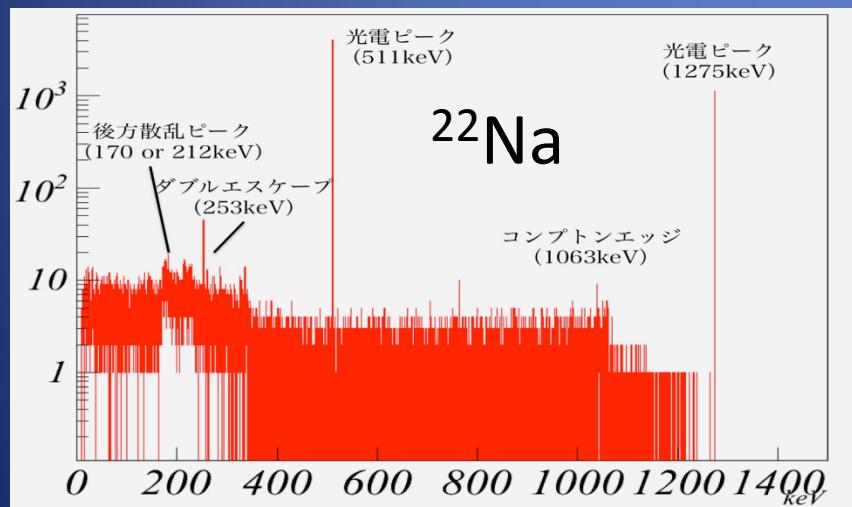

- Gamma source
  - $^{137}\text{Cs}$  ; 662 [keV] gamma-ray
  - $^{22}\text{Na}$  ; 511 [keV] and 1275 [keV] 5:9 gamma-ray
  - $^{60}\text{Co}$  ; 1170 [keV] and 1330 [keV] 1:1 gamma-ray
- Position of gamma source
  - inside and outside of chamber

inside  
outside

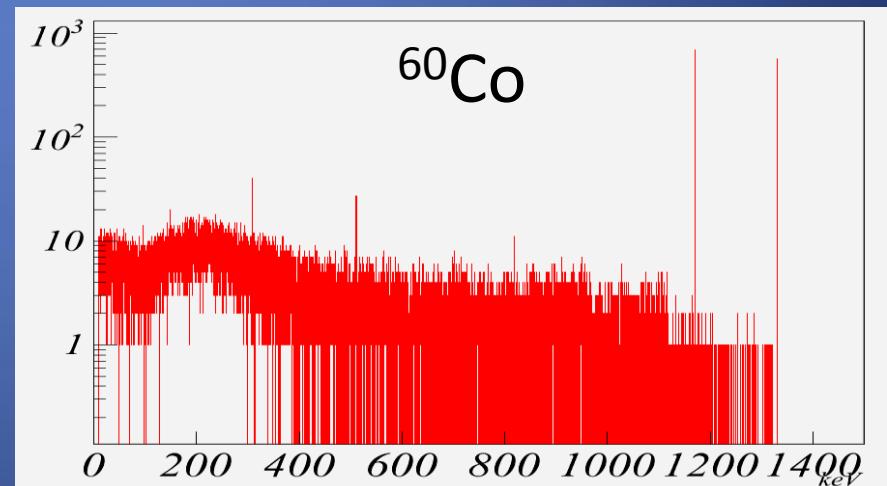

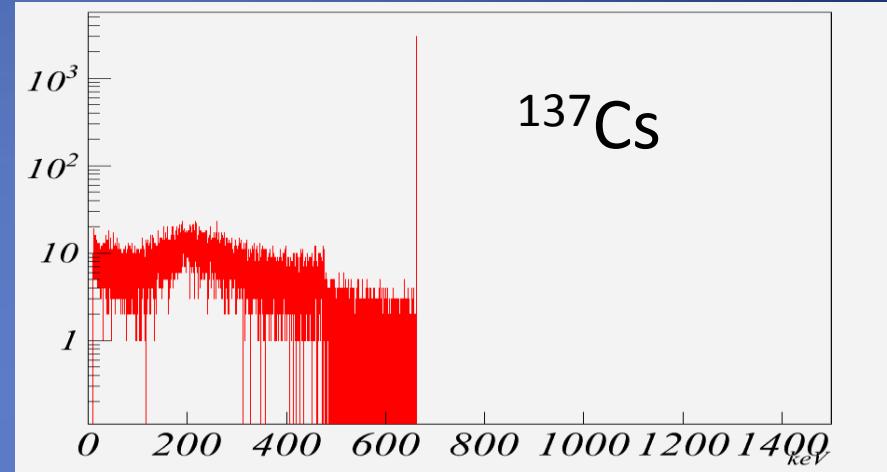

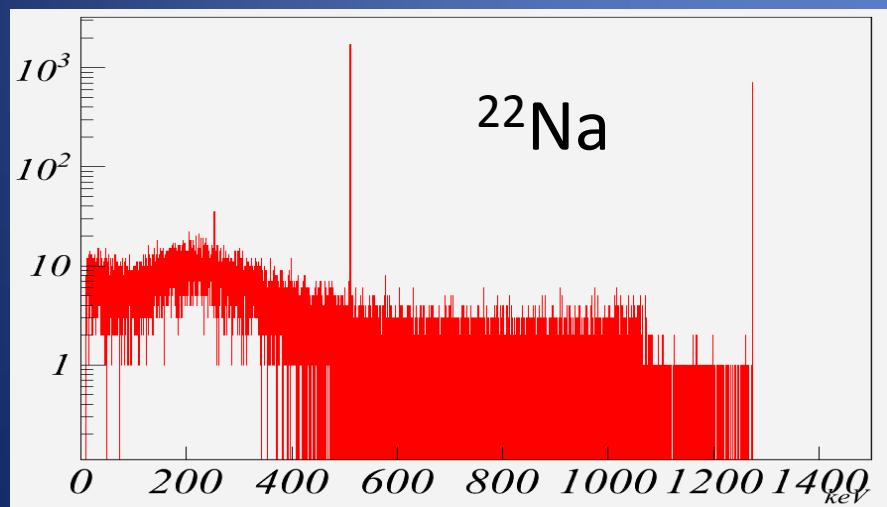

# Results of Simulation (inside)

- Results when I put gamma source inside chamber

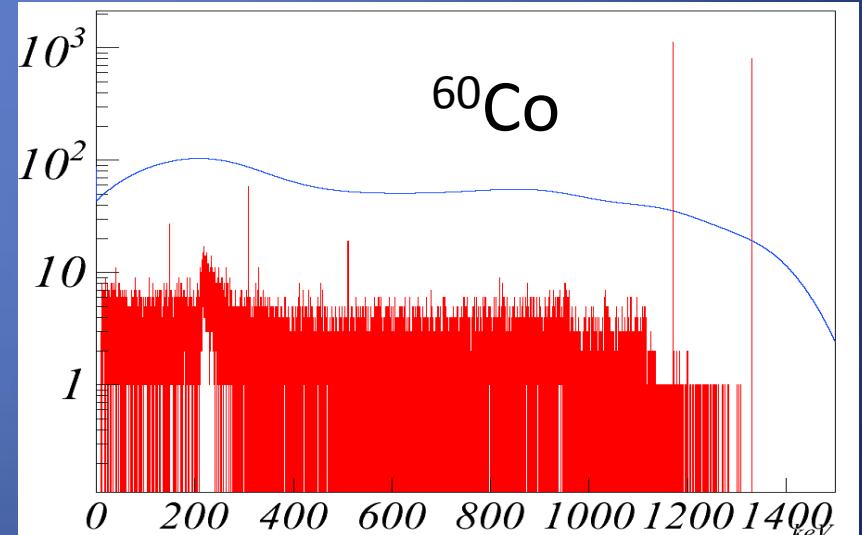

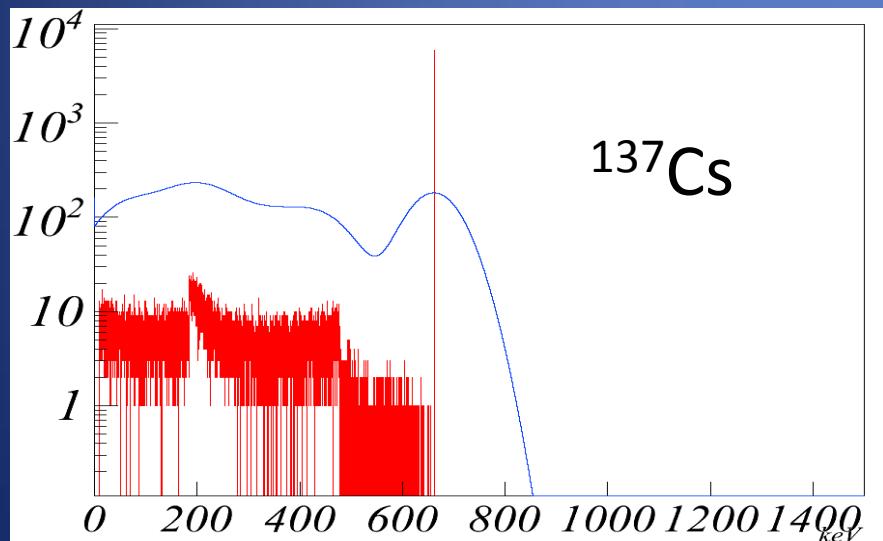

# Results of Simulation (outside)

- Results when I put gamma source outside chamber

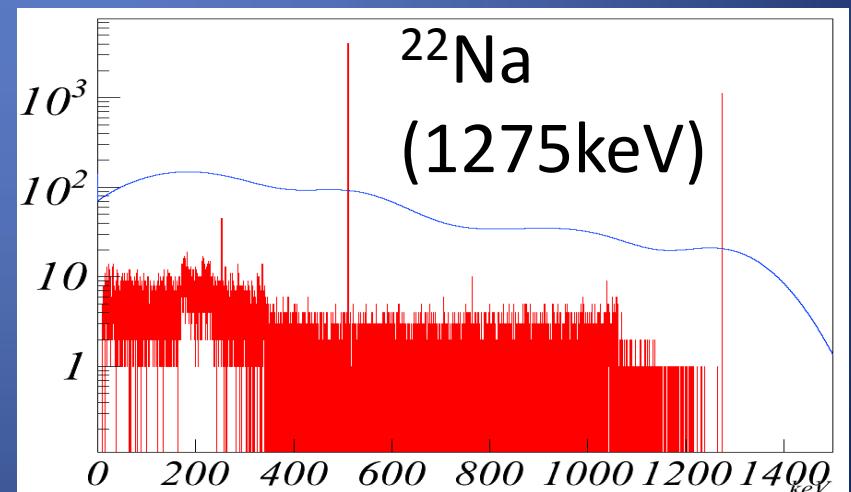

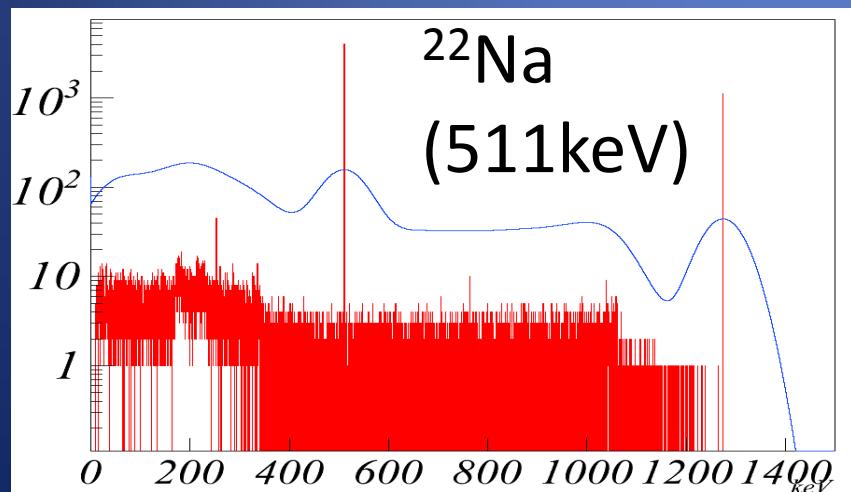

# Convolution

- Energy resolution is 18% (by experiment).
- Blue lines show results of convolution.  
(convolution to results of inside)

# Convolution

- These are results of convolution to Na spectrum.
- Left one is convolution at 511 [keV] peak.
- Right one is convolution at 1275 [keV] peak.

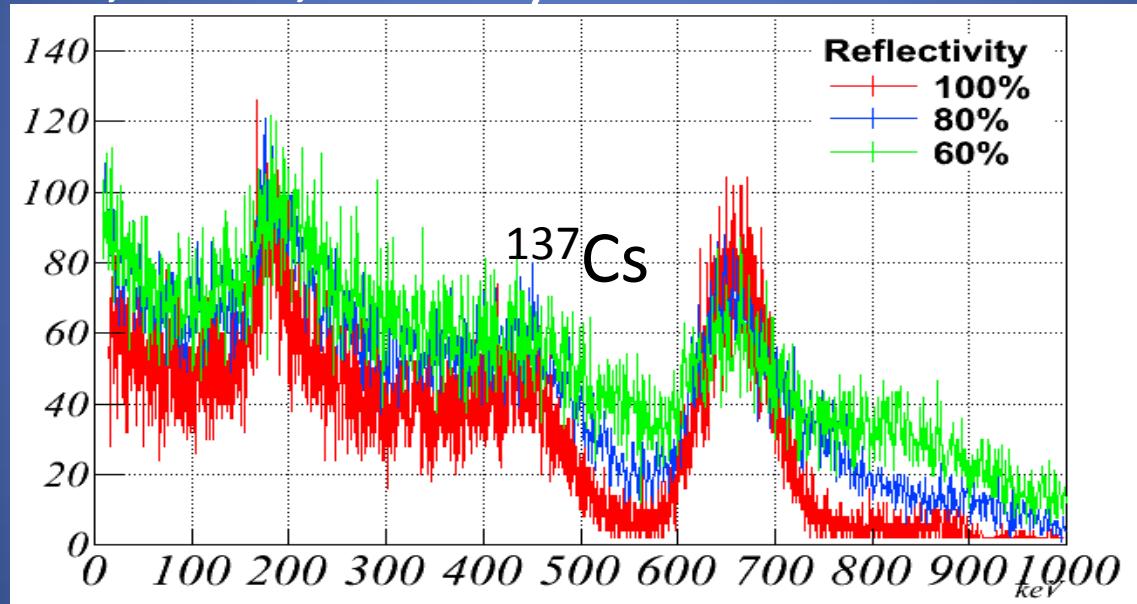

# Count Optical Photon

- Count optical photon being incident on PMT
- ResolutionScale due to fluctuation of optical photon number
- Fluctuation follows Gaussian distribution
$$\sigma = \text{ResolutionScale} / \sqrt{E \times \text{ScintillationYield}}$$
- ScintilaltionYield is  
(number of optical photon)/MeV

# Change Reflectance of PTFE Reflector

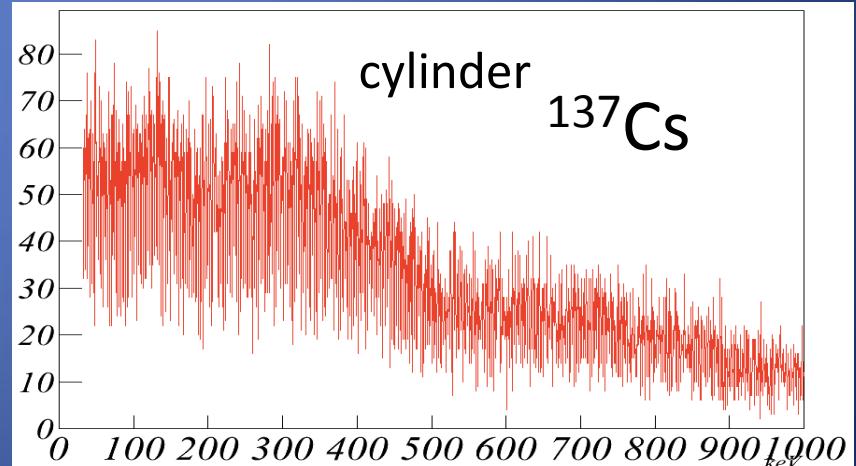

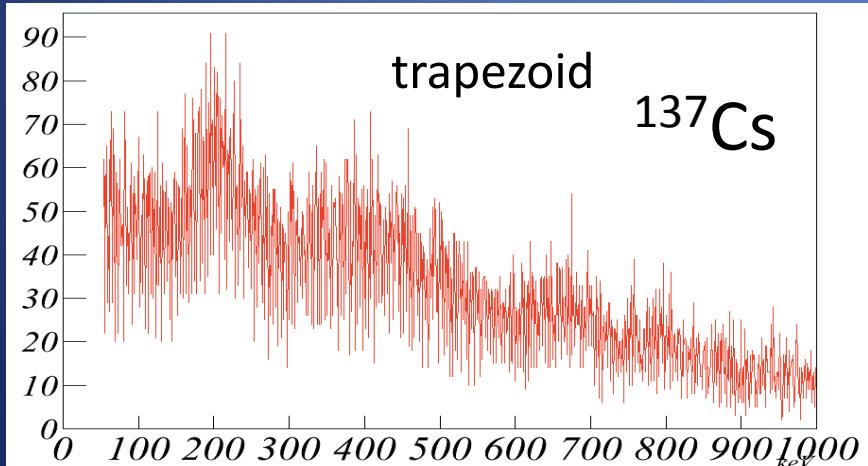

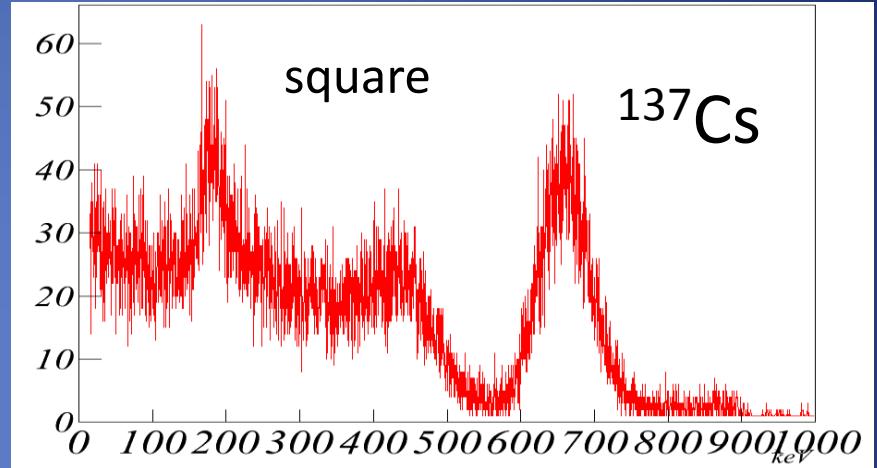

- Change reflectance of PTFE reflector  
(60%, 80%, 100%)

Reflectance [%]	Energy resolution [%]
100	14
80	16
60	18

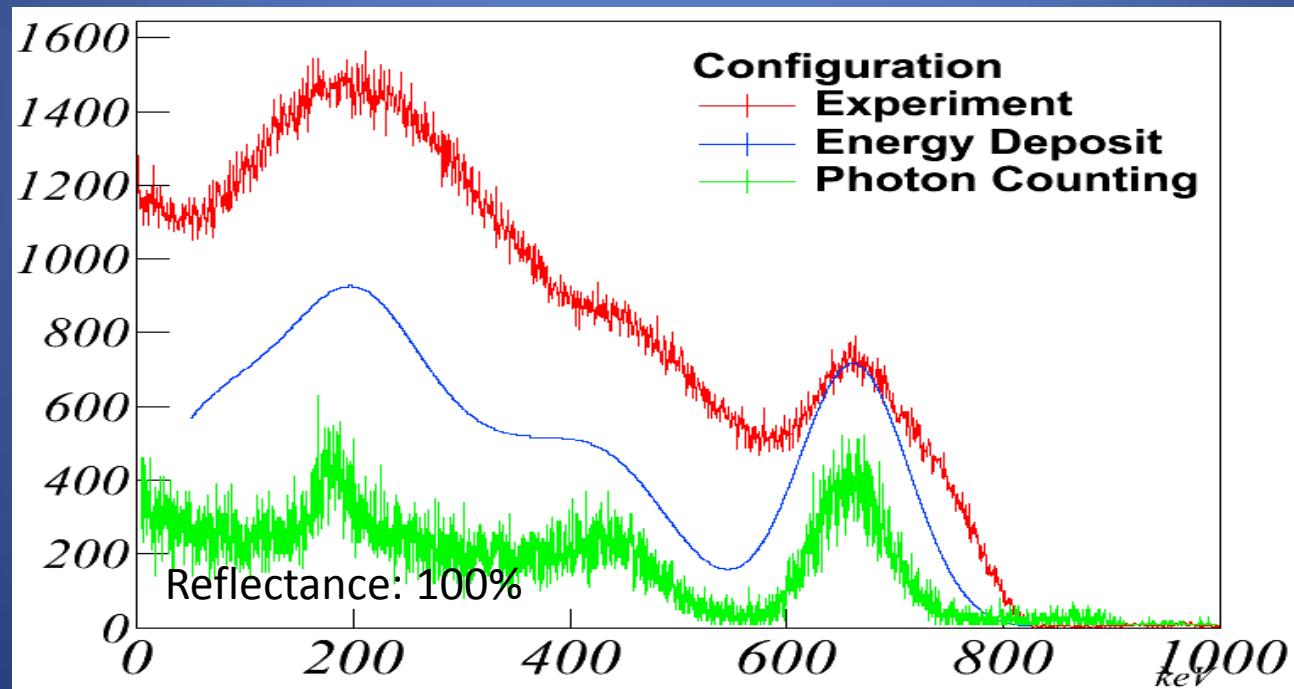

# Change shape of PTFE reflector

- Shape was set square , cylinder and trapezoid.
- Reflectance is 100%

# Compare

- Shape of PTFE reflector is square.

# My Study

- Improve development environment
  - incorporate ROOT option into CMake
- Change viewer (most useful viewer)
  - openGL (default Geant4 viewer) to VRML or DAWN
- Remort system
  - connect my PC to our laboratory PC from remote

# Next

- Input PTFE parameter and gamma source parameter more exactly
- Consider energy deposit of optical photon in LXe

```

for(size_t i=0;i<pmtHit.size();i++)
{
    op= pmtHit[i]-> GetOp();
    if(op>10){   G4cout << "RunAction: " <<op << "counts" << G4endl;
        h1 = (TH1D*)gROOT-> FindObject("Scintillation");
        h1-> Fill(op);
    }
}

for(size_t i=0;i<photonHit.size();i++)
{
    if(op>10)
    {
        G4double effi =(G4double)op/(photonHit[i]->GetPhoton());
        h1 = (TH1D*)gROOT -> FindObject("Efficiency");
        h1 -> Fill(effi);   G4cout << "Efficiency: " <<effi*100 <<"perCent" << G4endl;
    }
}

for(size_t i=0;i<scintiHit.size();i++)
{
    G4double edep = scintiHit[i]->GetEdep();
    h1 = (TH1D*)gROOT-> FindObject("Energy Spectrum");
    h1-> Fill(edep/keV);
    if(/*edep/keV==661*/op>3500)
    {
        G4double posy=scintiHit[i]->GetY();
        G4cout << "High Photons Detect: y = "<< posy << G4endl;
        h1 = (TH1D*)gROOT-> FindObject("YPosition");
        h1-> Fill(posy/mm);//,op);
    }
}

```
